

*A high-performance
loudspeaker engineered with
a patented Acoustic Wave®
system enclosure to deliver
extended bandwidth bass
reinforcement for permanent
installations*

FACILITIES HAVE UNIQUE NEEDS

BOSE® HAS UNIQUE SOLUTIONS

*Purer bass with greater
flexibility of system design
and installation*

Acoustic Wave® speaker technology produces no audible distortion, so the deep, rich bass cannot be localized. This enables the Acoustic Wave® Cannon system to be separated from speakers reproducing mid and high frequencies, increasing placement options. And unlike conventional box enclosures, its tubular design allows it to be easily nested against large surfaces like walls, floors and ceilings, taking advantage of acoustic bass-loading techniques for increased low-frequency sound.

High bass output

A high-powered 12" (30.5 cm) woofer delivers bass down to the lowest threshold of hearing, adding fullness to music that few speakers can match.

*Compatibility with a variety
of Bose speaker systems*

The OC-1 option card can be installed in any Bose system controller. It allows the Acoustic Wave® Cannon system to provide low frequency sound reinforcement in systems using Bose 802®, 502® or 402™ loudspeakers.

Reliable performance

This loudspeaker is engineered and tested to meet the demands of professional installed sound applications, and is backed by a transferable five-year limited warranty.
